Hiring Manager Re: Software Engineer – Full Stack (React / C# .NET)

Dear Hiring Manager,

I am writing to apply for the full-stack Software Engineer position. I am motivated by teams that expect engineers to own work across the stack—shipping responsive React interfaces, solid C#/.NET services, and well-tested features with honesty, grit, and collaboration. With well over two to four years of professional software development experience, I am ready to contribute immediately and keep growing with your platform.

My back-end foundation is strongest in C# and .NET. I have designed, developed, and maintained business applications and APIs using ASP.NET MVC, Web API, and related Microsoft technologies, working extensively with SQL Server—including T-SQL procedures, functions, and jobs. At MedBen, I engineered a Flexible Spending Account system to replace a legacy platform, collaborated on inbound/outbound eligibility processing, and enhanced a client-facing web portal. At Heating And Cooling Products, I modernized applications across business units and supported production workflows. At Tsunami Software, I helped convert a VB6 order entry application to ASP.NET MVC4. Across these roles I have debugged issues across the stack, collaborated with stakeholders to define and ship features, and written maintainable, documented code in agile environments.

On the front end, I most recently built a suite of tools for a hardware store that unifies product lookup, store inventory control, product grouping with tags, and physical retail barcode label creation in one application. That suite uses a React front end with a Python backend, and I developed it end to end—designing reusable UI flows, integrating with back-end services, and iterating quickly with Cursor AI while reviewing, testing, and owning the code I ship. Combined with my C#/.NET and SQL Server experience, this reflects the full-stack mix your team needs: React for responsive interfaces, .NET for robust services, and relational data skills for real business workflows.

I bring strong problem-solving skills, clear written and verbal communication, and the ability to work independently as well as on a team. I participate fully in agile delivery—planning, shipping, and improving—and I am eager to deepen React patterns (including state management and TypeScript) while continuing to strengthen C#/.NET API and service design.

I would welcome the opportunity to join your engineering team, help improve user experience, and ship features that grow the platform. Thank you for your time and consideration.

Sincerely,

Daryl Roudebush 740.817.1655 daryldeanr@gmail.com
